## Turning operational data into coordinated action

I analyze demand, resource availability, readiness, and execution constraints to help teams make practical operating decisions. My experience combines high-volume fleet planning with technical aviation operations, with a focus on identifying bottlenecks, monitoring performance, and coordinating improvements.

| Operating scale | Performance evidence |
| --- | --- |
| Approximately 1,000 fleet assets daily<br>Across four high-volume locations | Contributed to a 20% reduction in operational delays |
| Activities involving 50+ personnel<br>Operations, Maintenance, and Customer Service | Quality performance maintained above 85% |

## Evidence aligned to the role

- Analyze workflows and constraints: connect reservations, returns, vehicle readiness, and branch capacity to daily operating requirements.

- Use data to guide improvements: maintain Excel dashboards and KPI reports, identify bottlenecks, and translate findings into operational action plans.

- Support implementation: communicate priorities and schedule changes across teams and monitor execution as conditions change.

Inside this portfolio: SIXT workflow case study, an illustrative process map and KPI framework, and concise aviation case studies demonstrating readiness, quality, and technical coordination.

PORTFOLIO / 02

# SIXT workflow and process analysis

Sixt Rent A Car | Fleet Planner | Orlando, FL
August 2023 - Present

Daily fleet planning connects changing customer demand with vehicles, branch capacity, maintenance readiness, and execution teams. My work helps identify constraints before assignments and coordinate adjustments across four locations.

## Analyze the operating picture

- Review reservation and return forecasts, branch utilization, vehicle availability, and daily averages in SIXT Cobra to assess allocation needs and capacity risks.

- Evaluate workshop orders, maintenance history, mileage, rental duration, and decommissioning dates to identify readiness conflicts before planned assignments.

- Track vehicle movements, locations, cleaning, and fueling status through Lynx International Products Rental Solution 2.0.

## Translate findings into operational action

- Develop and maintain daily fleet schedules, balancing forecast demand, available vehicles, and resource utilization.

- Identify bottlenecks and coordinate dispatch, transfers, and schedule adjustments with Operations, Maintenance, and Customer Service.

- Maintain Excel dashboards and KPI reports; communicate performance findings and action plans to managers, rental agents, and garage teams.

## Reported results and scope

| Evidence | Result or scope |
|---|---|
| Process improvement contribution | Contributed to a 20% reduction in operational delays while maintaining quality performance above 85%. |
| Daily planning coverage | Approximately 1,000 fleet assets across four high-volume locations. |
| Cross-functional execution | Coordinated scheduling activities involving 50+ personnel. |

The improvement is presented as a contribution to the operational result, rather than an outcome attributable to one person or a single change.

# Workflow analysis framework

ILLUSTRATIVE FRAMEWORK

This generalized process map reflects the type of operational analysis described in the SIXT case study. It is a portfolio illustration, not a company SOP, system screenshot, or reproduced internal deliverable.

| Process stage | Analysis and decision focus |
|---|---|
| 1 Review demand | Compare reservations, expected returns, and near-term branch requirements. |
| 2 Assess readiness | Check availability and constraints affecting vehicle assignments, including maintenance and preparation status. |
| 3 Identify bottlenecks | Compare required capacity with ready capacity; identify dependencies that could delay execution. |
| 4 Coordinate response | Prioritize allocations and transfers; communicate operating priorities and schedule changes. |
| 5 Monitor and adjust | Review throughput, delays, and quality; reassess the plan when demand or readiness changes. |

## Questions that guide the analysis

- Where does work wait between a vehicle becoming available and being ready for assignment?
- Is the constraint driven by availability, preparation, maintenance, movement, or changing demand?
- Which team owns the next action, and what downstream activity depends on it?
- After an adjustment, do delays improve while quality remains acceptable?

## Communicating a recommendation

A useful recommendation connects the observed issue, supporting data, likely cause, proposed action, and follow-up measure. This structure makes the change easier for managers and operating teams to evaluate and carry out.

No internal thresholds, customer records, branch-level data, or proprietary procedures are reproduced here.

# KPI framework and improvement follow up

ILLUSTRATIVE FRAMEWORK

The following measures show how I would organize a process-performance discussion. Definitions and responses are illustrative; they are not claimed as SIXT reporting specifications or deployed dashboard designs.

| Measure | Illustrative definition | Decision supported |
|---|---|---|
| Fleet availability | Ready vehicles compared with vehicles required for the same location and period. | Identify capacity gaps and consider allocation or transfer priorities. |
| Throughput | Vehicles completing a defined preparation or movement stage per reporting period. | Locate slow stages and investigate resource or handoff constraints. |
| Delay rate | Delayed activities divided by total comparable activities, using an agreed definition of delay. | Investigate recurring causes and assess whether a change improves execution. |
| Quality performance | Activities meeting agreed quality criteria divided by comparable activities reviewed. | Check that faster execution maintains service and operating quality. |

## A practical review cycle

- Agree on definitions: specify the reporting period, population, data source, and accountable owner before comparing results.

- Check the evidence: review missing or inconsistent records and distinguish demand changes from process issues.

- Investigate causes: examine where delays occur and discuss the constraints with the teams performing the work.

- Monitor the response: compare like-for-like periods, review quality alongside speed, and adjust the action when results warrant it.

## Experience behind the framework

My actual work includes Excel dashboards, KPI reporting, operational performance review, and action planning. I also review reservation cost data, branch transactions, rental performance, service ratings, and customer surveys to improve visibility and support planning decisions.

# Technical operations and application fit

## GPI Geospatial

Flight Systems Operator | Orlando, FL | December 2021 - November 2022

Supported planning and execution of 200+ aerial survey missions, coordinating schedules and validating mission readiness. Operated, monitored, and troubleshot airborne survey systems; collaborated with pilots, engineers, and technical personnel to resolve operational issues.

Reviewed technical and geospatial deliverables for quality assurance and project reporting, and assisted with schedule tracking and continuous process improvements. This experience adds evidence of readiness analysis, technical problem-solving, quality review, and clear operational communication.

## TripleAviation

Airframe and Powerplant Technician Apprentice | March 2021 - December 2021

Assisted with material planning and inventory coordination to improve parts availability and reduce maintenance delays. Supported maintenance, inspections, troubleshooting, and repairs on Cessna Citation and Gulfstream business aircraft.

Reviewed engineering documentation, maintenance records, and technical manuals to support accurate work under FAA regulations and manufacturer requirements. The role built practical understanding of technical dependencies, controlled procedures, and aircraft return-to-service schedules.

## Tools and working methods

| Tools | Applied experience |
| --- | --- |
| Microsoft Excel | Operational reports, dashboards, KPI tracking, and performance analysis. |
| SIXT Cobra | Forecasts, utilization, vehicle availability, and allocation planning. |
| Lynx International Products Rental Solution 2.0 | Inventory, reservations, rental agreements, reporting, and vehicle status tracking. |

## Value for an Operations Process Analyst team

I bring hands-on experience examining workflows, identifying bottlenecks, communicating findings, and coordinating operational changes. My strongest evidence combines daily data analysis with practical knowledge of the people, assets, and technical constraints that determine whether a process works.
